

Do academic background and travel styles influence a person's map aligning ability: An eye tracking approach

Hao-Yu Liao ○

Advisor: Tzai-Hung Wen ○

Department of Geography, National Taiwan University ○

Imagine a scenario...

External environment

1. Find our location and destination
2. Which direction am I facing?
 - → Integrate the two coordinate systems

Alignment Effect

- Alignment effect

- People maintain the perspective adopted during first learning (Levine et al 1982)
- Alignment effects are **the extra time and effort** required to **rotate** the mental representation of physical maps. (Shephard & Hurvitz 1984; Finke 1990; Lloyd 1989 1997; Golledge 1999; Shephard & Metzler 1971)

- Map alignment

- Aligned map
- Misaligned map
- Counter-aligned map

Factors in alignment effect

- **Spatial configuration** (Presson et al 1989; Thorndyke-Roth 1982; Féry and Magnac 2000)
- **Cognitive styles** (Nori & Giusberti 2002)
 - **visual/ route/ survey representations** (Siegel and White 1975; Pazzaglia et al 2000)
- Mental rotation

Factors in alignment effect

- Mental rotation (Nori & Giusberti 2002)
 - People with higher **mental rotation ability** are more likely to get free from alignment effect (Pazzaglia & De Beni 2004)
 - Mental rotation also affects a person's cognitive styles (Pazzaglia & De Beni 2001)
- What shapes a person's mental rotation ability?
- Is mental rotation a **NATURE** or **NURTURE** thing?

Nature vs. nurture

- Nature

- Biological factors such as hormonal factors or hemispheric specialization and brain organization
- Evolutionary theories (Buss 1999; Geary 1998)

- Nurture: spatial experiences

Spatial tasks

(eg. Cherney & Neff 2004)

Spatial activities

(Ginn and Pickens 2005)

Educational experience

(Burnett & Lane 1980;
Casey, Colon & Goris 1992;
Quaiser-Pohl & Lehmann 2002)

Social gender role

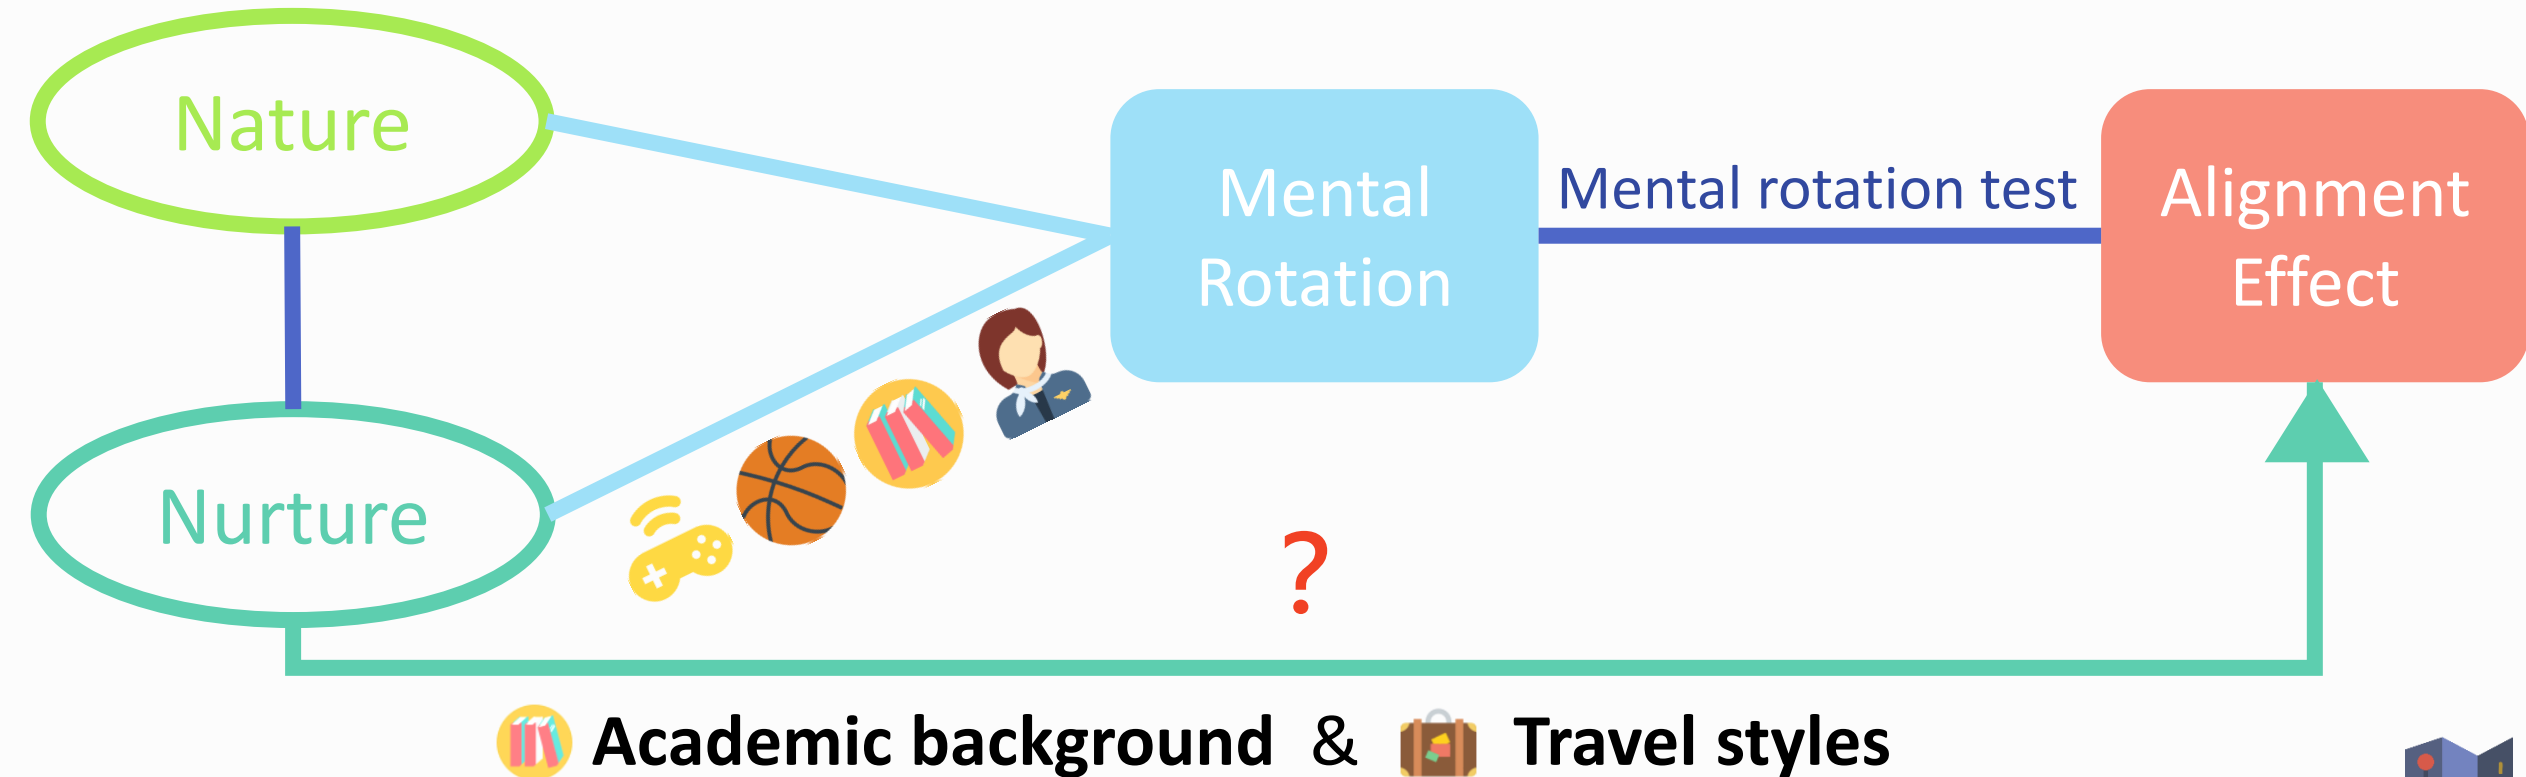

(eg. Eagly & Wood 2002;
Lippa et al. 2010)

- The interaction of nature and nurture (Casey 1996; Casey et al. 1992; Casey, Nutall & Pezaris 1999; Quaiser-Pohl, Geiser & Lehmann 2006)

Nature vs. nurture

- Biology and experience are intertwined in a manner that is difficult to separate (Halpern and Tan 2001).

The influence of nurture / experiences

Academic background

(Burnett & Lane 1980; Casey, Colon & Goris 1992; Quaiser-Pohl & Lehmann 2002)

- Previous studies have proofed its relationship with mental rotation

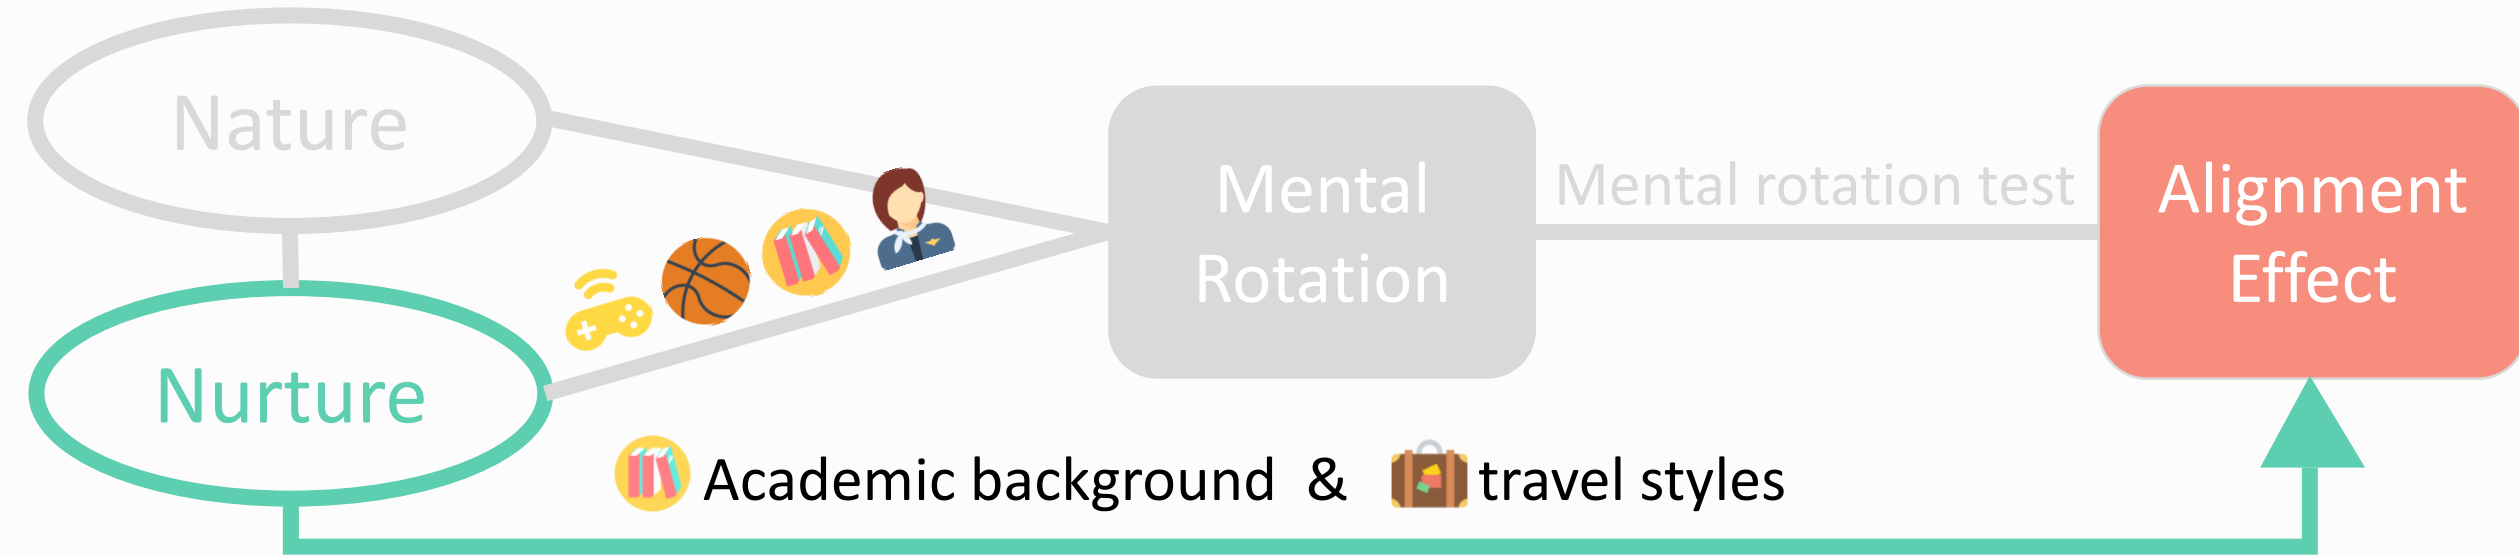

Travel styles

- **Practice** with misaligned maps improves performance with them (MacEachren 1992).
- **Spatial knowledge** are indeed varied with previous experience with **transport modes** (Mondschein et al. 2010).
 - Cognitive travel styles (active / passive / mixed)

THE RESEARCH PURPOSES

- Are students from **math and science background** more free from map alignment effect?
- Do **travel experience** influence the performance on map aligning?
- What's the difference between people who had higher and lower score on map aligning?

METHOD – Cartographic design theory

Dent, B. D. 1999. Cartography – *Thematic Map Design*. Fifth Edition. WCB McGraw – Hill.

- The two centers of an image space
- The eye movement through an image

METHOD – Eye tracking

- The process of **measuring and recording gaze positions and eye movements**
- Most of the eye trackers are mounted to a monitor and record a stream of pixel coordinates that the user has looked at.
- Applications
 - Psychological science
 - Visualization and human-computer interaction sciences

Eye tracking helps understand **how** people see or read things, and provide insights into users' ways of reasoning and problem solving.

Figure and snapshot from: <https://s3.eu-central-1.amazonaws.com/theeyetribe.com/theeyetribe.com/dev/general/index.html>

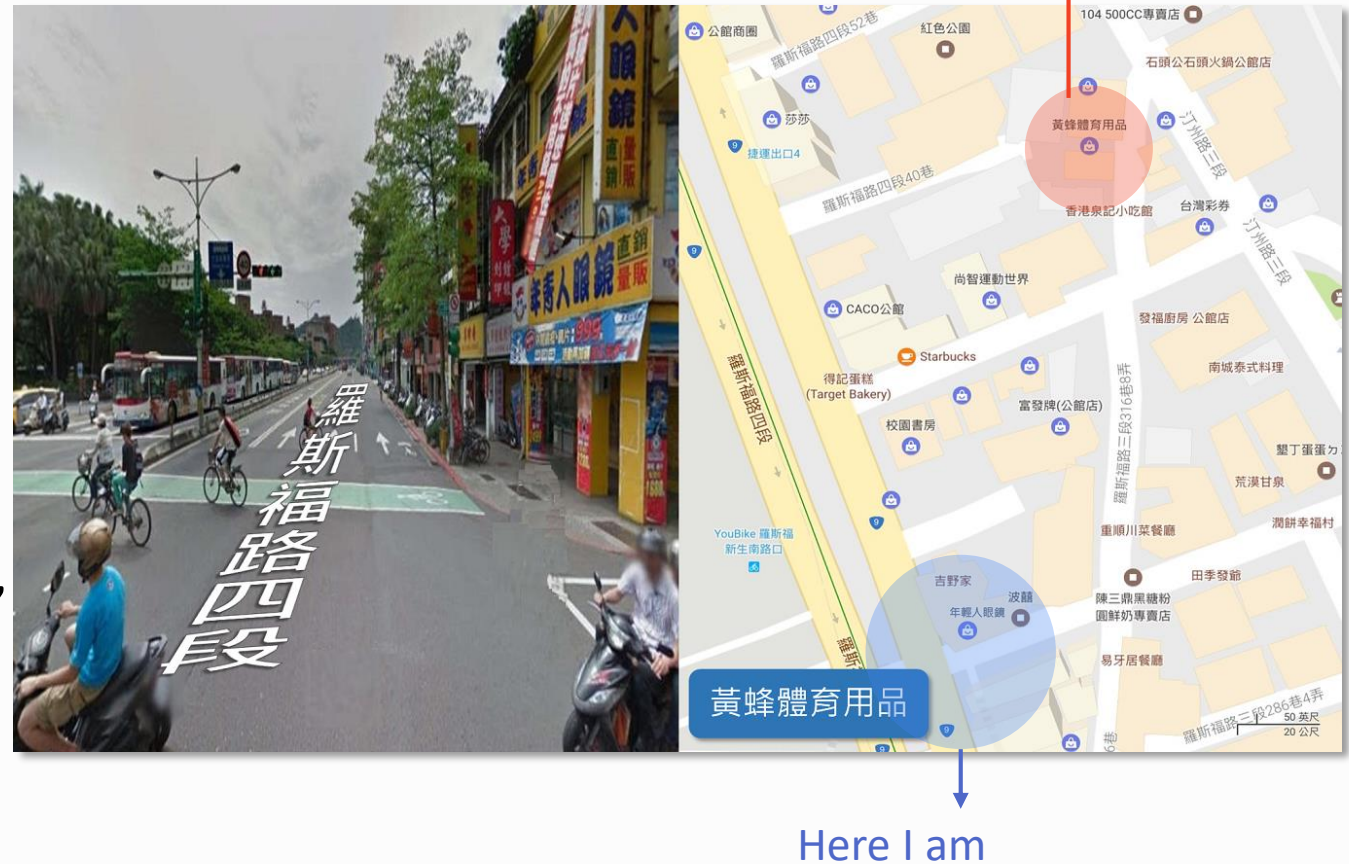

EXPERIMENT

- Apparatus: **The Eye Tribe** (eye tracker)
- Software: **Ogama** for experiment designing, recording and analyzing
- Time: Feb. 21 – Mar. 3, 2017 (about 2 weeks)
- Participants
 - 12 subjects: 6 males and 6 females
 - Age: 18 – 30
 - Students from National Taiwan University

EXPERIMENT – tasks design

- 6 map aligning tasks
- In each task:
 - Be informed of their location and destination by words
 - Align the map to the environment (15 secs)
 - Answer “**from their standpoint**, which direction is the destination?”

* “**Here I am**” and **destination** are NOT on the map in the experiment.

RESULTS

PART 1

Do academic background and travel experience affect alignment performance?

Math courses

Travel styles

Interaction

PART 2

How can people improve their map aligning performance?

Fixations

AOI transitions

- Through eye tracking, where's **the difference** between the two groups with **high and low score on map aligning?**

■ Map

■ Street-view

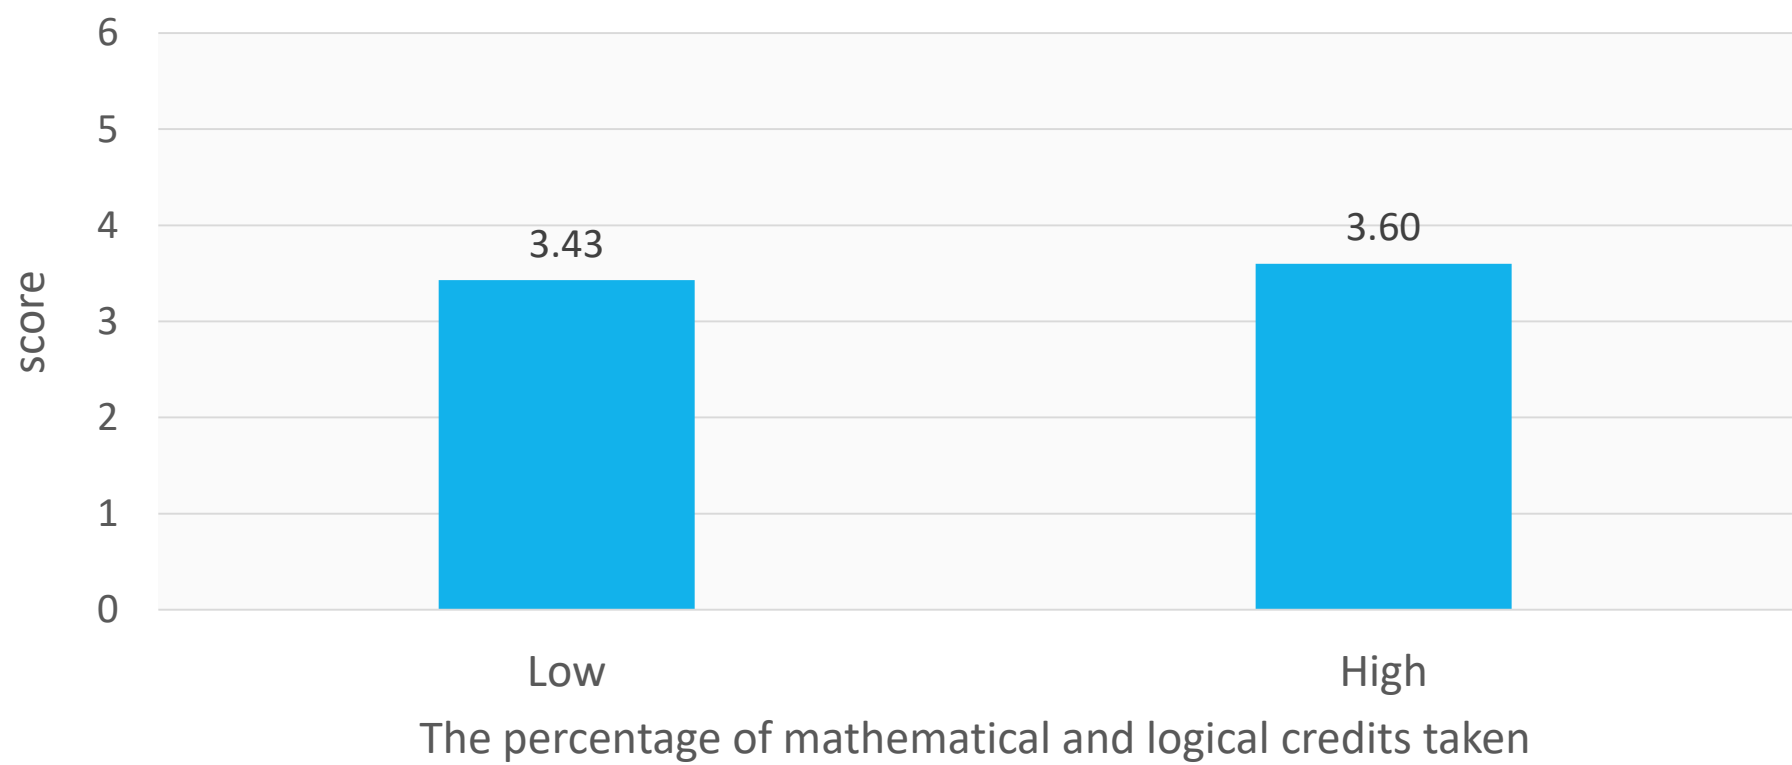

RESULTS

PART 1

Math courses

The score of map aligning among students taking **more or less mathematical credits**

Math_LOW	
Mean	0.105
Median	0.124
Standard deviation	0.088

< median

Math_HIGH	
Mean	0.259
Median	0.244
Standard deviation	0.064

>= median

RESULTS

PART 1

Travel styles

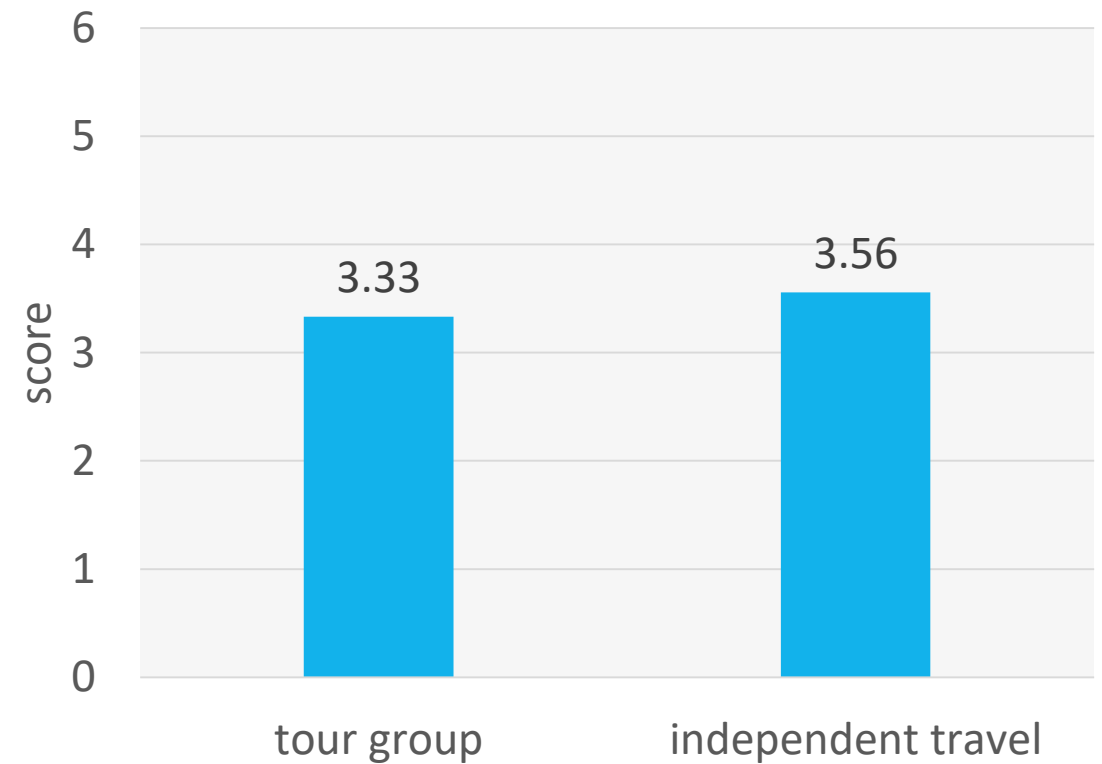

Travel transportation

Travel types

The score of map aligning among students with different **travel transportation**

The score of map aligning among students with different **travel types**

RESULTS

PART 1

Interactions

Math courses

travel styles

The score of map aligning among students with different **travel transportation** and **mathematical course credits**

The score of map aligning among students with different **travel types** and **mathematical course credits**

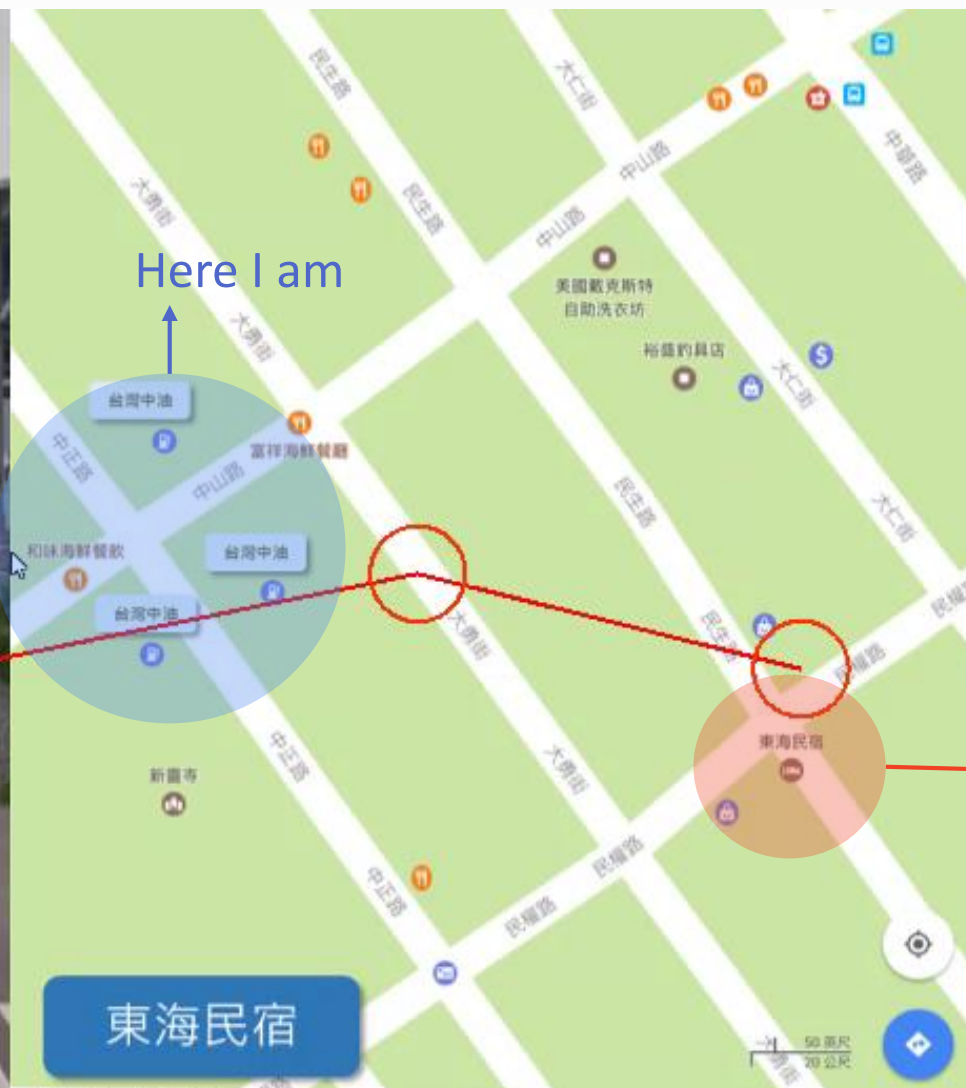

RESULTS

PART 2

* "Here I am" and **destination** are NOT on the map in the experiment.

case 1: high score on map aligning

Destination

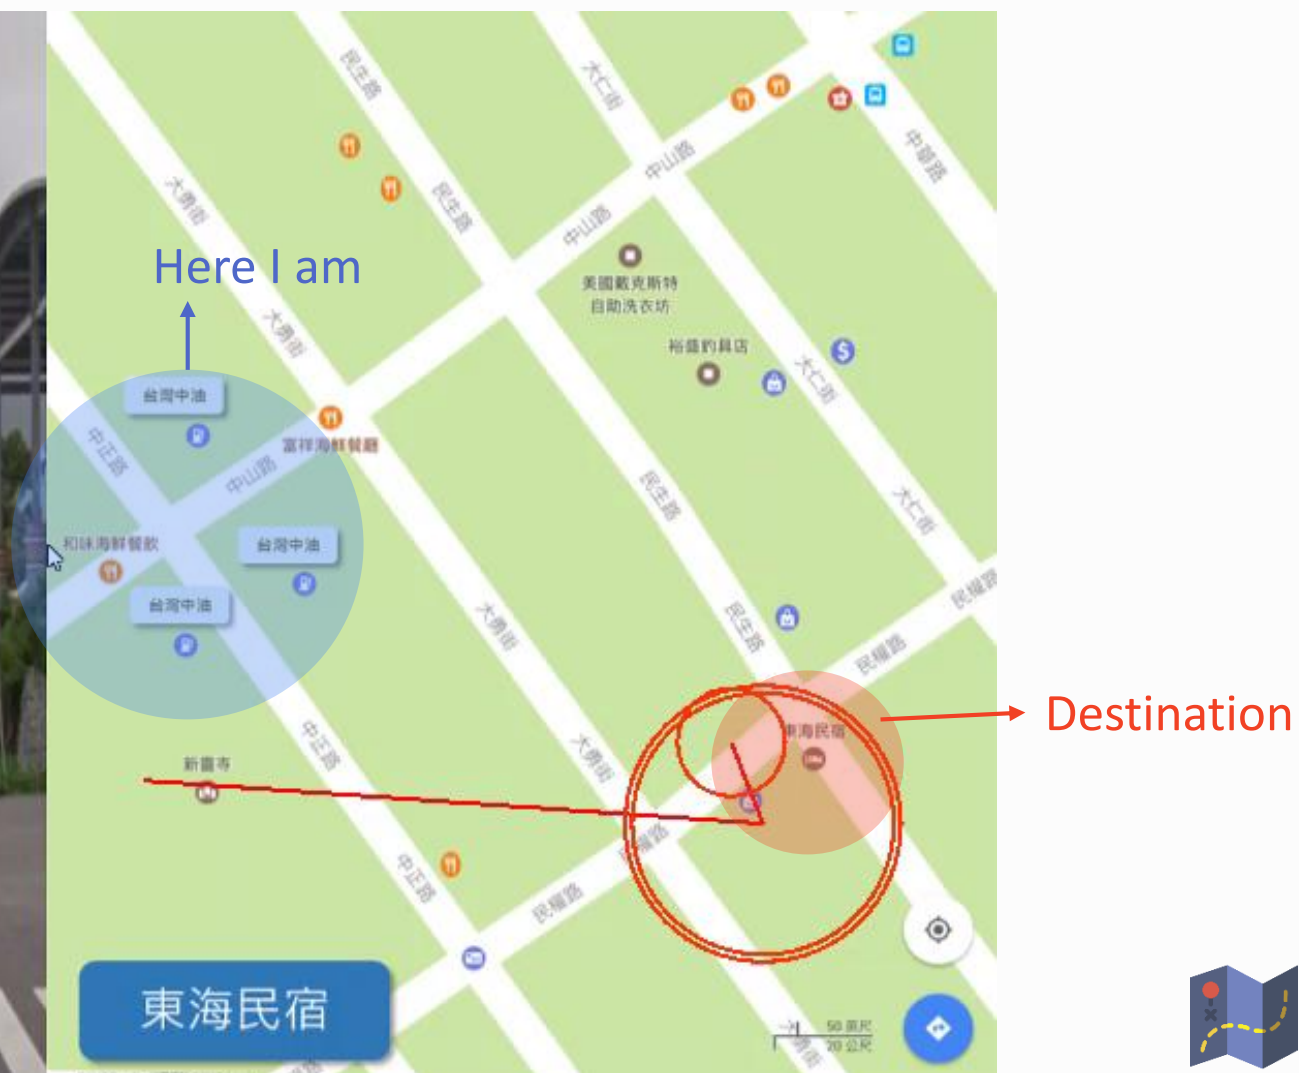

RESULTS

PART 2

* "Here I am" and **destination** are NOT on the map in the experiment.

case 2: low score on map aligning

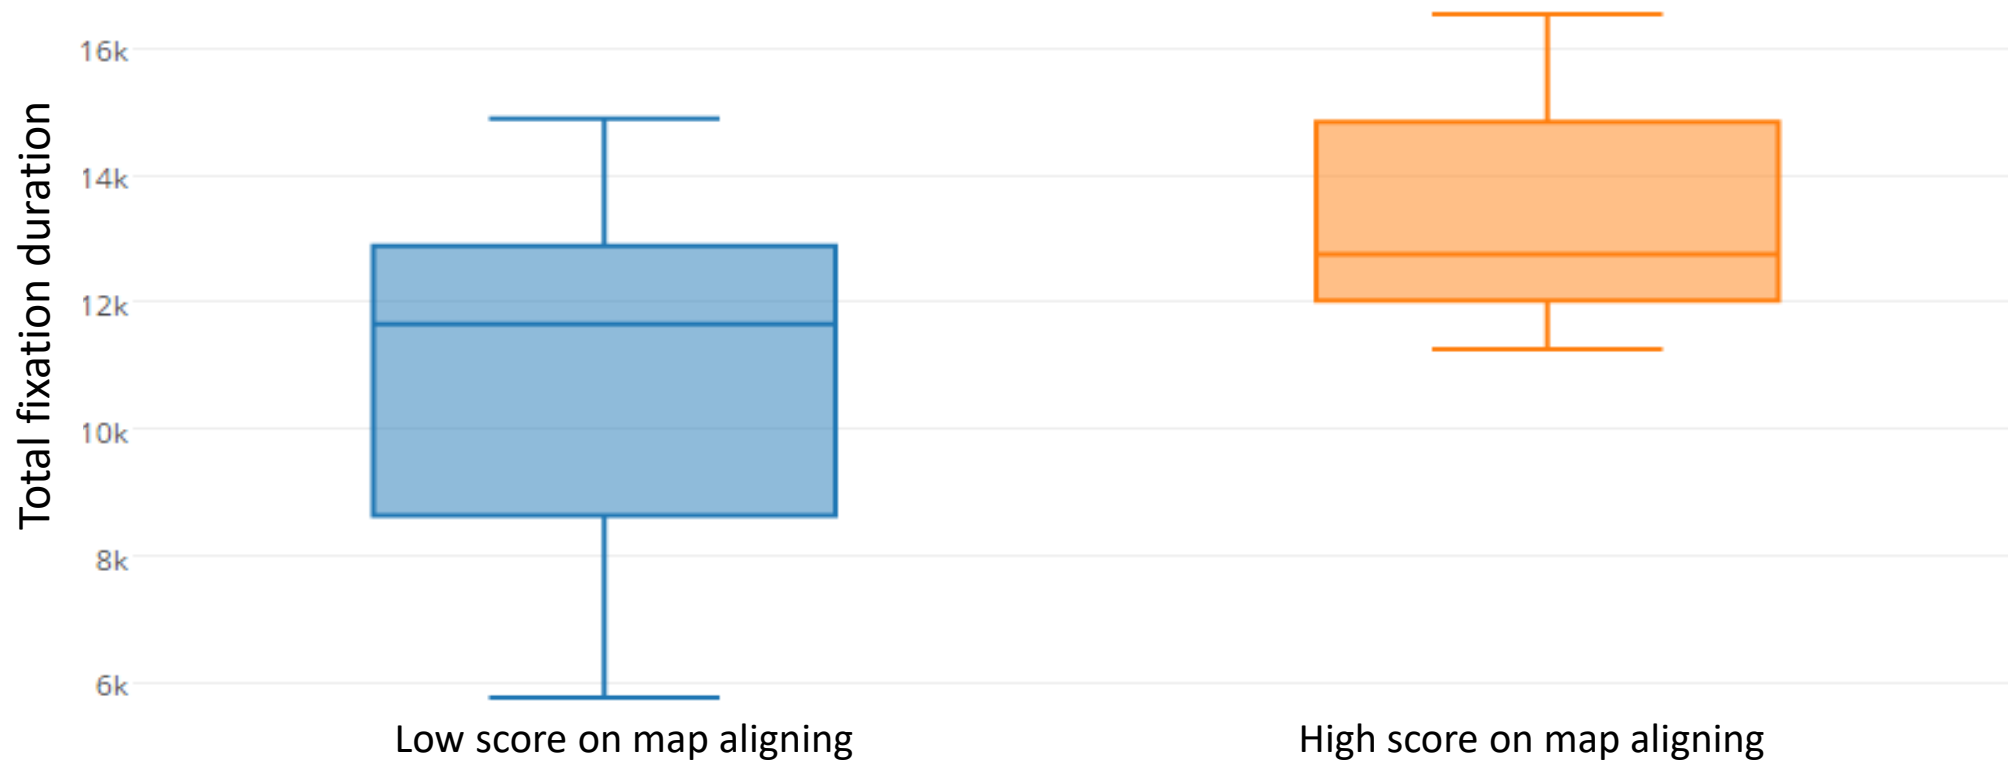

RESULTS

PART 2

Fixations

Fixation duration among students with high and low score on map aligning

RESULTS

PART 2

AOI transitions

- Map
- Street-view

Map and street-view transitions among students with high and low score of map aligning

SUMMARY

- Due to the small number of sample size, it would be too sloppy to assert that the percentage of gained **mathematical credits** determines a person's **map aligning performance**.
- However, it seems to have **a tendency** that different **travel styles** could affect a person's map aligning ability.
 - Transportation used
 - Travel types
- Through eye tracking, the **process** and **behavior** of map aligning could be revealed.
 - The engagement in the process
 - The number of times of transitions between map and street-view

FUTURE WORK

- **Collect more samples** to do statistical analysis
- **Define critical AOIs to analyze the AOI transitions or sequences** and generalize the reading process or strategies
- **Apply GIS trajectory similarity analysis** to systematically group different patterns of eye movement, and observe strategies of map aligning
- The results from eye trajectory analysis could provide more pragmatic implications and work in **broader fields** such as **spatial cognition, spatial ability or wayfinding**.

Thank you!
